Covid-19 Rise, Vaccine Hesitancy Frustrate Doctors in Hospitals Saturated by the Delta Variant

‘It’s too late for them to get the vaccine,’ an ICU nurse in Arkansas said. ‘It’s been pretty demoralizing.’
We are living with enormous uncertainty during a time of rapid change!
Burnout and secondary traumatic stress in health-system pharmacists during the COVID-19 pandemic

Abstract

Purpose: To describe the prevalence of burnout and secondary traumatic stress (STS) in health-system pharmacists during the coronavirus disease 2019 (COVID-19) pandemic.

Methods: A cross-sectional, professional pharmacy organization listserver-based online survey of a target group of health-system pharmacists across the United States was conducted. The survey was sent out through professional organization listservers and was anonymous and voluntary. The survey questionnaire included items regarding demographics and employment characteristics, COVID-19-related questions, a survey of respondents' perceptions of the prevalence and severity of burnout, and the Professional Quality of Life Scale (ProQOL). The ProQOL assessed respondents for compassion satisfaction (subcategorized as burnout and STS) and compassion fatigue. Descriptive statistics was used to assess the prevalence of burnout and STS.

Results: Four hundred eighty-four health-system pharmacists completed the survey. Based on respondents' self-ratings of burnout, 47% were identified as having current burnout and 81% as having a history of burnout. Based on ProQOL scoring, 65.3% of respondents were identified as having a moderate or high likelihood of burnout, which was a prevalence higher than that indicated by respondents' self-ratings. Additionally, 51.4% of respondents were identified as having a moderate or high probability of STS and 99.4% as having a moderate or high probability of compassion satisfaction.

Conclusion: The survey found that over half of health-system pharmacists were affected with burnout, half with STS, and all with compassion satisfaction during the COVID-19 pandemic. Unfortunately, the development of burnout and STS in these health-system pharmacists may lead to several work-related consequences (eg, increase risk of medical errors, depression); therefore, addressing burnout and STS is crucial. Further studies of the consequences of burnout and STS during the COVID-19 pandemic are needed.
Outline of Talk

• Introduction
• Discussion of COVID Impact on Health Care Workers
• Gender related impact
• Impact on vulnerable populations
• What can you do to increase resilience and constructive coping? (specific pearls and tips)
• Discussion of UNC Well-Being Program initiatives
Healthcare workers on the front lines of the COVID-19 pandemic risk exposure to the coronavirus daily, and this poses obvious risks to their physical health. But the public health crisis is taking a toll on their mental health as well, contributing to anxiety, stress, depression, loneliness and other concerns, as outlined in a pair of new surveys.
Health Care leaders are immersed in the responsibility of managing all that COVID brings to the organization:

- Securing personal protection equipment
- Managing capacity demands
- Dealing with staffing complexities
- Educating the community
- Dealing with the media
- Eliminating elective procedures

It is like putting 15 pounds of beans in a 10-pound bag. Something will give.
• The balance of life and work has never been tougher.

• A person feels a need to be at work to take care of their patients and support the organization, but now has their child at home because of virtual school or because the daycare center is unavailable.

• Extended family cannot be counted on as they once were because of the fear of COVID.

• Staffing is now a greater challenge because so many people are unavailable due to quarantining and other family commitments.

• You may be looked upon as a resource for friends, family, and others.

  Similar to a pain threshold with a patient, what was at one time a 5, 6, or 7 is now moving into the 8, 9, or 10 range.

• This means an organization must continue to address stress and resiliency, while also implementing a toolkit for dealing with trauma.
#MoralInjury injury to an individual's soul #moral conscience & values from an act of perceived moral transgression, producing profound emotional guilt & shame, and for some a sense of #betrayal #anger + profound moral disorientation #Veteran #Doctor #RN #Journalist #humanitarian
Moral injury in medicine “occurs when clinicians are ... expected, in the course of providing care, to make choices that transgress their longstanding, deeply held commitment to healing” [1].

Moral injury has been discussed as an occupational hazard in medicine before the COVID-19 pandemic [2], including in a recent project on developing moral resilience [3]. However, the current crisis has exposed the depth and breadth of moral injury’s potential impact upon entire networks of healthcare workers.

### THE FOUR Stress Injuries:

<table>
<thead>
<tr>
<th>Life Threat</th>
<th>Loss</th>
<th>Inner Conflict</th>
<th>Wear and Tear</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A traumatic injury</strong></td>
<td><strong>A grief injury</strong></td>
<td><strong>A moral injury</strong></td>
<td><strong>A fatigue injury</strong></td>
</tr>
<tr>
<td>Fear or experience of exposure to harm to self or others, fear of harming others inadvertently, existing in uncertainty.</td>
<td>Due to the loss of people, things or parts of oneself.</td>
<td>Due to behaviors or the witnessing of behaviors that violate moral values.</td>
<td>Due to the accumulation of stress from all sources over time without sufficient rest and recovery.</td>
</tr>
</tbody>
</table>
## Injuries and Ideals Place Us On the Stress Continuum

<table>
<thead>
<tr>
<th>READY</th>
<th>REACTING</th>
<th>INJURED</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Green)</td>
<td>(Yellow)</td>
<td>(Orange)</td>
</tr>
</tbody>
</table>

### Definitions
- **READY**
  - Optimal functioning
  - Adaptive growth
  - Wellness
- **REACTING**
  - Mild and transient distress or impairment
  - Always goes away
  - Low risk
- **INJURED**
  - More severe and persistent distress or impairment
  - Leaves an emotional/mental “scar”
  - Higher risk

### Causes
- **READY**
  - Any stressor
- **REACTING**
  - Feeling irritable, anxious or down
  - Loss of motivation
  - Loss of focus
  - Difficulty sleeping
  - Muscle tension or other physical changes
  - Not having fun
- **INJURED**
  - Loss of control
  - Panic, rage or depression
  - No longer feeling like normal self
  - Excessive guilt, shame or blame

### Features
- **READY**
  - At one’s best
  - Well-trained and prepared
  - In control
  - Physically, mentally and spiritually fit
  - Mission-focused
  - Motivated
  - Calm and steady
  - Having fun
  - Behaving ethically
## Keep Up with Your Confidence

<table>
<thead>
<tr>
<th>Trust</th>
<th>Hope</th>
<th>Self-Worth</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trust in:</td>
<td>Forgiveness of self</td>
<td>Belief in self</td>
<td>Making sense</td>
</tr>
<tr>
<td>Peers</td>
<td>Forgiveness of others</td>
<td>Accurate self-concept</td>
<td>Purpose</td>
</tr>
<tr>
<td>Equipment</td>
<td>Imagining the future</td>
<td>Self-respect</td>
<td>Faith</td>
</tr>
<tr>
<td>Leaders</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Mission</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Warning Signs of Excessive Stress

Below are symptoms you may experience if you are under excessive stress. If these symptoms last for more than 2-4 weeks and/or interfere with your relationships, work or daily functioning, you may need to seek care.

**Cognitive**
- Difficulty thinking clearly,
- Disorientation,
- Confusion,
- Difficulty problem-solving & making decisions,
- Memory issues,
- Distortion,
- Misinterpretation of situations & comments

**Emotional**
- Fear or terror,
- Perceived danger,
- Anger,
- Hostility,
- Frustration,
- Irritability,
- Deep sadness,
- Difficulty maintaining emotional balance

**Behavioral**
- Risk-taking,
- Failure to use PPE,
- Refusal to follow orders,
- Endangerment of others,
- Increased use/misuse of drugs or alcohol,
- Reduced ability to support peers,
- Conflicts with others,
- Withdrawal,
- Isolation

**Physical**
- Rapid heart rate,
- Palpitations,
- Muscle tension,
- Headaches,
- Tremors,
- Gastrointestinal issues,
- Nausea,
- Inability to relax,
- Trouble sleeping,
- Nightmares,
- Flashbacks,
- High adrenaline

You can't pour from an empty cup.

Take care of yourself first.
A rise has been observed in mental health disorders.

Individuals affected by emotional, behavioral and psychiatric disorders tend to be more numerous than those affected by COVID-19.

The fear of contracting COVID-19 seems not to be as high as concerns about the psychological and social impact of the pandemic, as reported in a United Kingdom survey (Mental health Covid-19, 2020).
Stressors related to the COVID-19 Pandemic

• Stressors related to COVID-19
  • potential exposure to the virus and loss of loved ones

• Secondary Adversities
  • economic difficulties
  • unavailability of food
  • psychosocial effects
  • disruption of future plans
  • underlying physical and psychological conditions
  • Health disparities

• (Islam et al., 2020; Pfefferbaum and North, 2020)
Emotional stress may potentially aggravate previous psychiatric conditions or may precipitate its symptomatology (Yao et al., 2020).

A critical aspect of this context is that, due to physical distancing, many elective appointments have been canceled and mental health support systems have been suspended, even though remote assistance is rapidly increasing (Holmes et al., 2020).
High Risk Groups for Mental Health Impact

- Groups that appear to be at higher risk for mental health impact, include:
  - frontline healthcare workers
  - the elderly
  - children
  - college students
  - LGBTQ+ community
  - homeless individuals and those in economic vulnerability
  - rural community
  - foreigners
  - psychiatric patients

-(Holmes et al., 2020; Khan et al., 2020; Salerno et al., 2020; Wood et al., 2020).
Health Care Professionals and Suicide

- Suicide mortality rates that were rising over the past two decades combined with the current pandemic are a “perfect storm”.

- Factors include economic stress, social isolation, reduced access to religious services, overall national anxiety, increased firearm sales and increases in health care provider suicides.

- The literature shows the relative risk for suicide being 2.27 times greater among female physicians and 1.41 times higher among male physicians versus the general population.
Psychological Disorders Secondary to the COVID-19 Pandemic

- Anxiety and Depression
- Post-traumatic Stress Disorder
- Alcohol Addiction

The hard truth is that COVID-19 has changed and will continue to affect how scientists live their day-to-day lives. As the world continues to struggle against the collective enemy, some attention should be placed on the mental health of the silent warriors on the laboratory bench. In the face of overwhelming odds against finding the vaccine for COVID-19 or the cure for cancer or dementia, researchers around the world should find solace in the fact that they are at the frontline of finding a better future for humankind.
Women in Medicine: The Impact of the Pandemic

Don’t Let the Pandemic Set Back Gender Equality

by Deepa Mahajan, Olivia White, Anu Madgavkar and Mekala Krishnan

WOMEN BELONG IN ALL PLACES WHERE DECISIONS ARE BEING MADE
The Pandemic Is a ‘Mental Health Crisis’ for Parents

New studies show caregivers with young children are stressed, with no signs of relief on the horizon.
Domestic Violence

- Social distancing may exacerbate the violence and maintain it less visible (Usher et al., 2020)
- Forced proximity, along with economic stress and disaster-related instability, are risk factors for aggression and domestic violence (Bavel et al., 2020; Usher et al., 2020)
- Distancing measures may lead to diminished access to community-based and familial support, with fewer opportunities to ask for help (Usher et al., 2020)
- Fear of COVID-19 and threats about contamination can even be used as a coercive mechanism to maintain the abuse

Impact of COVID-19 Pandemic on Psychiatric Patients

• In psychiatric patients, the COVID-19 pandemic might trigger an even worse outcome regarding mental health
  • Depression and Anxiety
  • Obsessive-Compulsive Disorder
  • Schizophrenia
  • Hospitalized Patients
Adolescent Distress During Covid

Consistent with theory highlighting the importance of peers during the adolescent period, the results showed that adolescents’ greatest concerns during the COVID-19 crisis were around the disruption to their social interactions and activities.

Concerns around contracting or getting ill from the virus were very low.

This suggests that it is the restrictions put in place to reduce the spread of the virus, rather than the virus itself, that is causing adolescents the most distress.

COVID-19 related worries, difficulties with online learning, and increased family conflict were associated with greater psychological maladjustment.

Greater exposure to traditional media, adherence to government restrictions, and feeling socially connected with others was associated with less distress.
Participants in the current study were part of the larger longitudinal Risks to Adolescent Wellbeing Project (the RAW Project) who have been completing online questionnaires annually for the past four years.

Psychological resilience refers to the phenomenon that many people are able to adapt to the challenges of life and maintain mental health despite exposure to adversity.

What Resilience is (and what it isn’t)!

- **Old Definition**
  - The ability to “bounce back” from a negative life event and return to a previous state of being

- **New Definition**
  - When experience with adversity leads us to develop a knowledge, skills, or attitudes that improve our ability to withstand future challenges

How do you help the healers? The Emotional PPE Project covers what masks and face shields don’t

The project makes free therapy available to health care workers facing unrelenting stress. And its cofounder understands firsthand the value of resilience.

By Melissa Karen Sances  Updated January 27, 2021, 2:52 p.m.
What can you do to be more resilient?

For our faculty currently experiencing decreased satisfaction in their work or who want to become “unstuck” from a day-to-day, downward spiral, we propose asking the following questions to raise self-awareness, allow reflection, and take the first steps to building resiliency:

• What did I learn today? Would I do anything differently?
• What three things am I grateful for today? What inspired me?
• How did I talk to myself today? Did I take myself too seriously? Did anything surprise me?
• Was I overly self-critical?
• Did I practice compassion (to self and others?)

Personal Protective Factors (in alphabetical order)

- **Competence** - The knowledge, skills, and attitudes needed to successfully perform a job or task
- **Faith/Spirituality** - A belief in God or a higher power that provides comfort, hope, and strength during times of stress or spirituality adversity
- **Flexibility** - A willingness to change
- **Hope** - Belief that something better is possible
- **Humor** - Prevents us from taking things so seriously, enhances our coping abilities, and reduces the intensity of our emotional reaction to stress
- **Meaning in life** - The ability to recognize a “purpose” or “meaning” in your experiences and the ability to identify your “why”
- **Optimism** - Positive outlook and/or favorable belief about a future outcome

Personal Protective Factors (cont.)

- **Perseverance** - Not easily discouraged by failure or barriers to success. You recognize the importance of continuing your efforts, especially if the outcome is related to your priorities or purpose.

- **Positive Emotions** - Approachable and supportive of others.

- **Self-awareness** - The ability to know yourself, monitor your emotions, and regulate your responses to others and situations.

- **Self-efficacy** - Confidence in your ability to perform a specific task in a particular situation.

- **Self-esteem/confidence** - A positive belief in your own self-worth or value.

- **Social support** - Family, friends, or others to whom you can turn to in times of need.

## Build a resilience plan

Use this tool to develop a plan for resilience that will help you overcome daily challenges and prepare for what's to come.

Supporting Clinicians during Covid-19 and Beyond —
Learning from Past Failures and Envisioning New Strategies

Jo Shapiro, M.D., and Timothy B. McDonald, M.D., J.D.

Clinicians are facing important emotional stressors during the Covid-19 pandemic, including grief from seeing so many patients die, fears of contracting the virus and infecting their family members, and anger over health care disparities and other systems failures. For some, these stressors have caused or exacerbated burnout, depression, or post-traumatic stress disorder, leaving improvements in workplace efficiency and workflow, increased supplies of personal protective equipment, and strengthening of communication with organizational leaders. Other efforts often meant to be appreciative, messages depicting clinicians as heroes imply an expectation of personal sacrifice at all costs. Well-being efforts have overemphasized personal resilience, thereby placing the burden of handling emotional distress solely on individual clinicians. Research has found, however, that organizational approaches to improving clinician well-being are more effective than
Welcome.
The Emotional PPE Project connects healthcare workers in need with licensed mental health professionals who can help.
No cost. No insurance. Just a trained professional to talk to.

All Services Provided Through The Emotional PPE Project Are Free Of Charge.
The Emotional PPE Project is a directory that provides contact information of volunteer mental health practitioners to healthcare workers whose mental health has been impacted by the COVID-19 crisis.

Taking Care of Our Own During COVID

**Extensive expansion during COVID & New Initiatives**

- Expansion of clinical, supportive and educational services

- Incorporation of additional clinicians who are supervised by director of TCOOO to provide more robust and accessible services

- New service line to provide mental health for all healthcare workers

- Address issues around DEI, systemic racism and recent sociopolitical events

- To assist in providing pointed needs assessment and plan development to promote wellness determinations and design interventions with corresponding research initiatives
Improving Work Life.
The integrated Well-Being Program is here to support co-workers and physicians across our health system and school of medicine.
Department of Psychiatry

The UNC Department of Psychiatry is committed to excellence in our missions of clinical service, teaching, and research, and we are national leaders in each of these domains.
